

PNW Entheogen Botany — DMT-Related Plants (Reference Only)

Botanical & legal reference · Oregon wetlands & flora · No extraction chemistry

No extraction or concentration instructions. DMT (N,N-dimethyltryptamine) is a Schedule I controlled substance in the United States. Manufacturing, extracting, or concentrating DMT — including from local plants — is a serious federal crime. This document provides *botanical identification and legal context only*.

Educational use only. Plant chemistry varies by population, season, and stress. Alkaloid content is unpredictable. Many extraction solvents and processes are toxic or explosive. Do not experiment.

1. What is DMT in a botanical context?

DMT is a tryptamine alkaloid found in trace amounts in some plants and animals. It is not “active” in the plant in a simple edible form — traditional Amazonian ayahuasca combines plants containing DMT with MAO-inhibiting plants to allow oral activity. Chemistry, legality, and toxicity of any extraction are outside the scope of responsible regional field guides.

2. Plants of interest in / near Oregon (botany only)

Reed canary grass — *Phalaris arundinacea*

Habitat: Extremely common in Oregon wetlands, ditches, and riparian zones — Willamette Valley and coast. Aggressive perennial grass.

Identification: Flat leaf blades; compact panicle seed head; often in monoculture stands in wet soil.

Chemistry note: Some populations contain *variable* levels of DMT-related alkaloids and gramine (toxic to livestock). Content is unreliable and many plants are low or nil. **Not suitable for any DIY use.**

Acacias & mimosas

Popular in online extraction forums (*Mimosa hostilis*, *Acacia confusa*) — **not native to Oregon** and not wild-forageable locally. Nursery ornamentals may appear in southern Oregon but are not “local

plants” for Eugene/Florence field work.

***Diplopterys cabrerana* / chacruna**

Amazonian ayahuasca admixtures — not found wild in Oregon.

Plant	In Oregon wild?	Notes
<i>Phalaris arundinacea</i>	Yes — ubiquitous wetland grass	Variable alkaloids; toxic gramine; no practical field use
<i>Mimosa</i> / <i>Acacia</i> spp.	Not native; rare ornamental	Internet “tek” sources refer to imported bark
<i>Psychotria viridis</i> (chacruna)	No	Tropical

3. Why “local DMT extraction” guides are absent from reputable sources

- **Illegality:** Extraction = manufacture of Schedule I substance.
- **Unreliable yield:** Phalaris chemotypes differ; most standing biomass is not meaningfully psychoactive.
- **Toxic co-alkaloids:** Gramine and related compounds harm livestock and humans.
- **Hazardous chemistry:** Non-polar solvents, lye, and improper ventilation cause fires, burns, and poisonings.
- **Ethical / ecological:** Wetland harvesting damages sensitive habitat.

4. Legal landscape (United States & Oregon)

DMT is Schedule I federally. Penalties for manufacture can exceed possession charges. Religious exemptions (e.g., certain ayahuasca church rulings) are narrow federal court exceptions — not a general right to extract local plants. Oregon has not legalized DMT parallel to Measure 109 psilocybin services.

5. If you are researching academically

- Consult peer-reviewed phytochemistry literature via university libraries.
- Dr. Duke’s Phytochemical Database (USDA) for reported constituents — not extraction protocols.
- Oregon Flora Project for correct plant ID before any discussion of chemistry.

6. Poisoning & emergencies

Plant exposures, solvent inhalation, or unknown concentrates: **Oregon Poison Center 1-800-222-1222**
· 911 for immediate danger.
