

Claw Xbox Premium — Settings Guide

Cronus Zen GPC Script • Xbox Series X|S / Xbox One • Call of Duty (BO6 / BO7 / Warzone)

Script file: `claw-xbox-premium.gpc`

Layout: Default Xbox — no bumper or trigger remapping

1. Before You Start

Required in-game settings (Call of Duty)

- Set your in-game button layout to whatever you normally use — the script does not remap buttons
- **Fire:** RT (default)
- **ADS:** LT (default)

Loading the script (first time only)

1. Connect Cronus Zen to your PC using the **PROG** port (right side).
2. Open **Zen Studio** on Windows.
3. Go to **File** → **Open** and select `claw-xbox-premium.gpc`.
4. Press **F7** to compile. Fix any errors shown in the output panel.
5. Drag the compiled script to a memory slot (1–8) in the Programmer panel.
6. Click **Program Device** to save it to the Zen.
7. Unplug from PC, connect Zen to Xbox, and select that slot on the Zen OLED.

Note: You only need a PC to load or update the script. All settings below can be changed on your Xbox controller once the script is programmed.

2. Opening the Mod Menu

You can open the menu **any time** the Cronus is plugged in — at the Xbox home screen or in a match.

Action	Controller Input
Open Mod Menu	Hold LT (left trigger) + press START
Confirmation	Controller rumbles + mod list appears on Zen OLED screen
Kill Switch (disable all mods)	Hold LT + press SHARE

When the Zen first loads, the OLED briefly shows **CLAW XBOX** and **LT+START** as a reminder.

3. Navigating the Menu

Action	Button
Scroll through mods	D-Pad UP / DOWN
Toggle mod ON or OFF	D-Pad LEFT / RIGHT
Enter value editor	Press A
Go back (from editor to mod list)	Press B
Save settings and exit	Press B from the mod list

Settings are saved to the Zen automatically when you exit with **B**. The menu also auto-saves and closes after **30 seconds** of no input.

While the menu is open, inputs are blocked from reaching the game so you won't accidentally shoot or open the Xbox guide.

4. All Mods — What They Do & Default Values

#	Mod Name	Default	What It Does	Editable Values
1	Anti-Recoil	ON	Pulls aim down while firing to reduce weapon kick	AR Vertical, AR Horizontal
2	Polar AA	ON	Always-on orbital aim assist enhancement	AA Radius, AA Speed
3	Hold Breath	ON	Auto-holds sprint while ADS (helps sniper stability)	Toggle only
4	Auto Run	ON	Automatically sprints when pushing the left stick forward	Toggle only
5	Slide Cancel	OFF	Auto slide-cancel when releasing crouch while moving	Slide Delay (ms)
6	Hair Trigger	ON	Instant full ADS response on LT (no trigger deadzone)	Toggle only
7	VM Speed	3	Script loop speed — higher = snappier mods (0–5)	Use LEFT/RIGHT to change 0–5
8	Move Boost	OFF	Extra forward stick speed while sprinting	Move Boost %
9	Hipfire AA	ON	Extra aim assist when not ADS	Toggle only

5. Editing Values (Step by Step)

- 1 Hold **LT** + press **START** to open the menu.
- 2 Use D-Pad **UP** / **DOWN** to highlight the mod you want (e.g. **Anti-Recoil**).
- 3 Press **A** to enter the value editor.
- 4 Use D-Pad to adjust:
 - **LEFT** / **RIGHT** = change by **1**
 - **UP** / **DOWN** = change by **10**
- 5 If the mod has multiple values (e.g. Anti-Recoil has Vertical and Horizontal), use D-Pad **UP** / **DOWN** to switch between them.
- 6 Press **B** to go back to the mod list.

7 Press **B** again to save and exit. The OLED will show **SETTINGS SAVED**.

Value ranges

Setting	Range	Recommended Starting Point
AR Vertical	0 – 99	15 – 22 (raise if gun still climbs)
AR Horizontal	-50 – 50	0 – 5 (use negative if gun drifts right)
AA Radius	1 – 50	10 – 15 subtle, 20+ stronger
AA Speed	1 – 50	15 – 20
Slide Delay	40 – 120 ms	75 ms default
Move Boost %	5 – 30	15
VM Speed	0 – 5	3 balanced, 4–5 snappier

6. Quick In-Game Adjust (No Menu)

You can fine-tune anti-recoil during a match without opening the full menu:

Action	Input
AR Vertical +1 / -1	Hold RS + D-Pad UP / DOWN
AR Horizontal +1 / -1	Hold RS + D-Pad RIGHT / LEFT
Save AR values to Zen memory	Hold RS + press VIEW

7. Toggling Mods ON / OFF

1. Open the menu (**LT** + **START**).
2. Scroll to the mod with D-Pad **UP** / **DOWN** .
3. Press D-Pad **LEFT** or **RIGHT** to toggle.
4. The Zen OLED shows **ON** or **OFF**. The LED blinks green (on) or red (off).
5. Press **B** to save and exit.

VM Speed is special: instead of ON/OFF, LEFT/RIGHT cycles through numbers 0–5.

8. Recommended Profiles

Low profile (subtle)

- Anti-Recoil: ON — Vertical **12–16**
- Polar AA: OFF or ON with Radius **8–10**
- Hipfire AA: OFF
- Hold Breath: ON
- Auto Run: ON
- Slide Cancel: OFF
- Move Boost: OFF

Balanced (default script settings)

- Anti-Recoil: ON — Vertical **18**, Horizontal **2**
- Polar AA: ON — Radius **12**, Speed **18**
- Hipfire AA: ON
- VM Speed: **3**
- Slide Cancel: OFF

Sniping focus

- Hold Breath: ON
- Anti-Recoil: ON — Vertical **10–14** (lower for snipers)
- Polar AA: ON — Radius **8–12**
- Auto Run: OFF (for positioning)
- Slide Cancel: OFF

9. Troubleshooting

Problem	Fix
Menu won't open	Hold LT first, then tap START (don't release LT too early). Make sure the correct script slot is selected on the Zen OLED.
Bumpers not working	Re-compile the latest script — older builds remapped LB/RB. This version leaves bumpers untouched.
Settings don't save	Always exit the menu with B — wait for SETTINGS SAVED on the OLED.
Anti-recoil too strong / pulls to floor	Lower AR Vertical in the menu or with RS + D-Pad DOWN in-game.
All mods stopped working	You may have hit the kill switch. Hold LT + SHARE to turn the script back ON.
Zen not detected on PC	Use the PROG port (right side), try a different data USB cable, update firmware in Zen Studio.

10. Controller Reference

This script uses **standard Xbox buttons** with no remapping. LB, RB, LT, and RT all pass through to the game exactly as your controller sends them.

Button	Script behavior
LT (left trigger)	ADS in-game; hold + START opens mod menu
START	Opens mod menu when LT is held
LB / RB	Not modified — work normally
RT	Not modified — fire as normal
